DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 01/12/11 has been entered.

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance:

The instant invention is distinguished over the prior art of record by a method for applying a color design to a surface of a wall around protrusions using a movable application device comprising a first position measurement system configured to measure a position of the movable application device relative to multiple stationary components, a computer unit, multiple paint application elements, a second position measurement system configured to measure a motion of the movable application device, and at least one roller or sliding element; particularly the when applying paint at a second position on the surface by using the second measurement system wherein the first measurement system is unable to provide valid position data due to disturbed intervisibility between the movable application device and stationary components by

relocating the paint application device to a third position on the surface, where valid position data is available from the first measurement system; *and subsequently moving the application device from the third position to second position, where the second position is calculated by the third position data and movement data from the second measurement system.* The prior art of record neither teaches nor suggests the combination of limitations recited in the instant claims.

Slupe [US 6942402] teaches a method of applying color design onto a surface [col, In 40-45] with obstacles [col 5, In 3-50] with a movable device [col 3, In 49-50] having a first position measurement system configured to measure its position relative to stationary components [col 9, In 5-20], further having a computer control (microprocessor) [abstract], paint application elements (print head) [abstract]. However, Slupe fails to teach a second measurement system, which is used at a step of applying paint at a second position on the surface when the first measurement system is unable to provide valid position data due to disturbed intervisibility between the movable application device and stationary components, by relocating the paint application device to a third position on the surface, where valid position data is available from the first measurement system; *and subsequently moving the application device from the third position to second position, where the second position is calculated by the third position data and movement data from the second measurement system.*

Mayfield [US 7029199] teaches an automatic ground marking apparatus (application device) [abstract] on turf playing fields or fairways [col 1, In 10] with paint application elements [col 2, In 45-47], where the prior art teaches moving the application

device on a surface [col 3, ln 6] and measuring a position of the application device by reflectors thereon relative to the base station (first measurement system) [col 2, ln 19-21, 26-27], the paint application elements are commanded to apply paint on the external surface based upon the second data and the position of the application device [col 5, ln 7-15, 26]. However, Mayfield fails to teach a second measurement system, which is used at a step of applying paint at a second position on the surface when the first measurement system is unable to provide valid position data due to disturbed intervisibility between the movable application device and stationary components, by relocating the paint application device to a third position on the surface, where valid position data is available from the first measurement system; *and subsequently moving the application device from the third position to second position, where the second position is calculated by the third position data and movement data from the second measurement system.*

Since the prior art of record neither teaches nor suggests the combination of limitations recited in the instant claims, one skilled in the art would not have been motivated to perform the claimed process.

Response to Arguments

In light of applicant's submitted amendments to claim(s) and arguments filed on 1/12/11, the examiner has deemed the claim(s) in condition for allowance.

Conclusion

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
